Contents

Preface ix

1. Introduction and Background 1
   1.1 Errare Humanum Est 1
   1.2 Why a Statistical Version of Nash Equilibrium? 5
   1.3 Six Guiding Principles for Statistical Game Theory 7
   1.4 A Road Map 8

2. Quantal Response Equilibrium in Normal-Form Games 10
   2.1 The Reduced-Form Approach: Regular QRE 13
   2.2 Two Simple Regular QRE Models 15
      2.2.1 The Luce Model and a Power-Law Generalization 16
      2.2.2 QRE Based on Distribution Functions 19
   2.3 Properties of Logit QRE 22
      2.3.1 Examples to Illustrate Logit-QRE-Based Refinements 24
   2.4 Alternative Models Related to Regular QRE 31
      2.4.1 Rosenthal’s Linear Response Model 31
      2.4.2 Van Damme’s Control Cost Model 32
   2.5 Structural Approach to QRE 35
      2.5.1 An Equilibrium Model of Action Trembles 35
      2.5.2 Structural QRE: An Equilibrium Model of Payoff Trembles 39
   2.6 On the Empirical Content of QRE 42
      2.6.1 Empirical Restrictions of Regular QRE 43
      2.6.2 Empirical Restrictions of Structural QRE 46
      2.6.3 Regularity with Structural QRE 48
      2.6.4 Structural versus Reduced-Form QRE 49
   2.7 QRE for Continuous Games 53

3. Quantal Response Equilibrium in Extensive-Form Games 63
   3.1 Regular QRE for Extensive-Form Games 67
   3.2 Structural QRE for Extensive-Form Games 72
      3.2.1 Notation 72
      3.2.2 Agent Quantal Response Equilibrium 74
CONTENTS

3.3 Logit AQRE 76
3.4 AQRE Analysis of the Centipede Game 85

4. Heterogeneity 88
  4.1 Skill and Role Heterogeneity 90
    4.1.1 Systematic Heterogeneity Depending on Player Roles 90
    4.1.2 Idiosyncratic Heterogeneity 90
  4.2 Heterogeneous Quantal Response Equilibrium 91
  4.3 Skill Heterogeneity without Rational Expectations 92
    4.3.1 Egoistic Beliefs about Opponents 92
    4.3.2 Unconstrained Point Beliefs about Opponents’ Skill 93
  4.4 QRE without Rational Expectations 94
    4.4.1 Subjective Heterogeneous QRE 94
    4.4.2 Truncated QRE and Cognitive Hierarchy 96
  4.5 Noisy Introspection 103
    4.5.1 Noisy Rationalizability 107
    4.5.2 Noisy Introspection in Extensive-Form Games 109

5. Dynamics and Learning 112
  5.1 QRE in Infinitely Repeated Games 113
    5.1.1 Notation 115
    5.1.2 A Finite Recursive Form for Repeated Games 116
  5.2 QRE in Dynamic and Stochastic Games 121
    5.2.1 Markov Perfect Equilibrium 122
    5.2.2 Logit Markov QRE 125
  5.3 Evolutionary Dynamics and Logit QRE 127
  5.4 Stochastic Learning Equilibrium 133
    5.4.1 Some Alternative Learning Rules 134
    5.4.2 Beliefs and Probabilistic Choice 137
    5.4.3 History Formation 138
    5.4.4 Stochastic Learning Equilibrium 138

6. QRE as a Structural Model for Estimation 141
  6.1 The QRE Estimation Approach 142
    6.1.1 Estimation Program for Generalized Matching Pennies 147
  6.2 Estimation and Methodological Issues 151
    6.2.1 Multiple Equilibria 152
    6.2.2 Estimation Methods 154
    6.2.3 Unobserved Heterogeneity 158
### CONTENTS

7. Applications to Game Theory
   7.1 The Traveler’s Dilemma
      7.1.1 Traveler’s Dilemma Experimental Data
      7.1.2 Logit QRE Claim Distributions
   7.2 The Compromise Game
      7.2.1 Simultaneous versus Sequential Compromise Games
      7.2.2 The Logic of Equilibrium
      7.2.3 QRE with Continuous Types and Binary Action Spaces
      7.2.4 Estimating QRE, TQRE, and $\alpha$-Cursed QRE
   7.3 Simplified Poker
   7.4 Signaling Games
      7.4.1 Banks, Camerer, and Porter (1994)
      7.4.2 Brandts and Holt (1992, 1993)
   7.5 Social Learning
      7.5.1 The Basic Model
      7.5.2 Nash Equilibrium
      7.5.3 AQRE in the Information Cascade Game
      7.5.4 Belief Dynamics Implied by QRE
      7.5.5 An Experiment on Self-Correcting Cascades
      7.5.6 Estimation

8. Applications to Political Science
   8.1 Participation Games
      8.1.1 General Participation Games
      8.1.2 Participation Games with Negative Externalities
      8.1.3 Participation Games with Positive Externalities
      8.1.4 Positive and Negative Externalities in Voting Games
   8.2 Incomplete Information and Voter Turnout
      8.2.1 QRE Model of Turnout with Private Information
      8.2.2 Experimental Data
      8.2.3 Asymptotic Voter Turnout Predicted by QRE
   8.3 Information Aggregation by Voting
      8.3.1 Rational Strategic Voting in Juries
      8.3.2 Experimental Data
      8.3.3 QRE Voting in Juries
   8.4 Markov QRE and Dynamic Legislative Bargaining
      8.4.1 Approximating MPE by Logit MQRE
      8.4.2 Steady-State Equilibrium Dynamics
      8.4.3 Using MQRE for Estimation
   8.5 Crisis Bargaining
# CONTENTS

9. Applications to Economics 248
   9.1 Imperfect Price Competition 249
      9.1.1 Learning and Convergence to Equilibrium 251
      9.1.2 Logit QRE and Logit SLE Price Distributions 254
   9.2 Minimum-Effort Coordination Games 257
      9.2.1 Stochastic Potential and Logit QRE 258
      9.2.2 A Coordination-Game Experiment 260
   9.3 All-Pay Auctions 261
      9.3.1 Rent Dissipation 265
      9.3.2 Own-Payoff Effects in Asymmetric All-Pay Auctions 267
   9.4 Private-Value Auctions 269
      9.4.1 Two Simple Auction Games 270
   9.5 Common-Value Auctions 273
      9.5.1 The Maximum-Value Auction Game 275
      9.5.2 Logit QRE for the Maximum-Value Auction Game 276
      9.5.3 Estimating HQRE for the Maximum-Value Auction Game 276

10. Epilogue: Some Thoughts about Future Research 281
    10.1 Theory 283
       10.1.1 Repeated Games 283
       10.1.2 Correlated Equilibrium, Preplay Communication, and Mechanism Design 284
       10.1.3 Endogenizing the Quantal Response Parameter 285
    10.2 Applications 286
       10.2.1 Bargaining Games: Legislative Bargaining, Offer/Counteroffer 286
       10.2.2 The Winner's Curse 286
    10.3 Methodology 287
    10.4 Closing Remarks 289
